AdStop

NETWORK PROTECTION · DNS FILTERING

Your home digital shield

The plug-and-play device that blocks ads and unwanted content across your entire home network.

NETWORK PROTECTION · DNS FILTERING

The Problem It Solves

Most households have no control over the ads, trackers, and unwanted content that reach every device on their network, AdStop solves this with a plug-and-play device that blocks them silently at the network level, requiring zero technical knowledge to set up.

Smart TV

No ad-blocker available natively

Smartphone

Protection limited to a single app

Console

Impossible to install extensions

PC & Tablet

Requires setup on every device

AdStop
NETWORK PROTECTION · DNS FILTERING

How It Works in 3 Steps

Immediate setup, no technical skills required.

1. Connect to the Router

Plug the AdStop power supply into a nearby electrical outlet. No complicated cables. A Wi-Fi connection screen appears on the display. Connect from your phone to the setup network created by AdStop. A captive portal will open where you can enter your network credentials.

2. Configures Itself

The device starts automatically and connects to the network. No manual configuration required.

3. Blocks Everything

From that moment on, every device connected to the network is automatically protected, without installing anything.

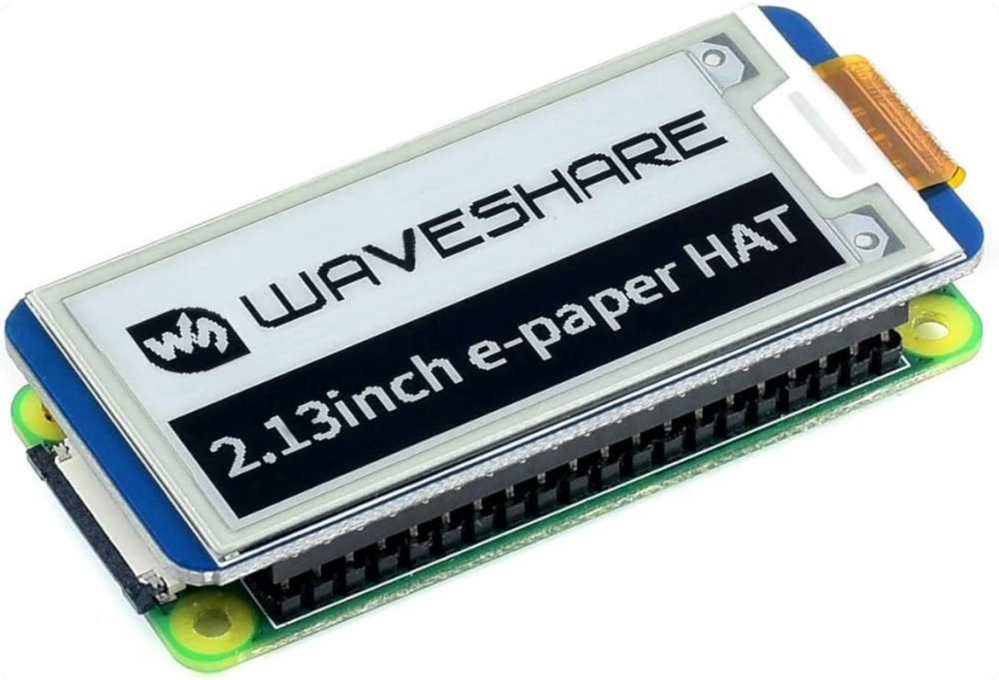
What's Inside



On-Board Hardware

AdStop is built around a **Raspberry Pi Zero 2W**, a powerful and compact mini computer, paired with an elegant **e-ink display** that shows blocking statistics in real time.

E-Ink Display

Shows how many ads it has blocked in real time, with near-zero energy consumption

Production Cost

< **50 euros** to build a complete unit

<50€

Hardware Cost

Per unit produced

2W

Consumption

Why It’s Different from a Normal Ad Blocker

AdStop works at the network level, **before ads even reach your device**. No installation, no per-device setup.

Protected Smart TV

TVs don’t support extensions. AdStop protects them without touching them.

Game Console

PlayStation, Xbox, Nintendo — all automatically protected by the network.

iPhone & Android

Full protection without installing apps or changing settings.

AdStop blocks unwanted DNS requests before they reach your devices — protection upstream, not downstream.

What It Can Block

AdStop doesn't just stop ads. It's a complete shield for the whole family, fully configurable from the app.

Advertisements

Banners, pre-roll videos, popups, and sponsored ads on every platform

Trackers

Tracking scripts that collect data on your online behavior

Gambling

Betting sites and online casinos, ideal for protecting younger users

Adult Content

Filter can be enabled for safe browsing for the whole family

Social Media

Blocks access to social media to reduce distractions when needed

The Control App

Complete Management in the Palm of Your Hand

A mobile and desktop app (currently in development) to give you total control over AdStop from anywhere.

Real-Time Statistics

View how many ads and trackers have been blocked today, this week, and this month

Filter Management

Turn blocking categories on or off with a simple toggle from the interface

Remote Control

Manage the device even when you're away from home, in total security

App in active development

Security and Updates

AdStop is designed with security at its core, not as an add-on. Every aspect of the system is built to protect both the home network and the device itself.

Automatic Updates

The firmware updates automatically remotely. No action is required from the user — always on the latest version.

Signed Unique License

Each AdStop device has a digitally signed unique license, ensuring authenticity and preventing cloning.

Encrypted Communication

All communication between AdStop and the cloud takes place through end-to-end encrypted channels, protecting your data.

Project Status

AdStop is a concrete project, with components already working. Here is where we are today on the path toward the launch of version 1.0.

85%

Cloud Backend

Complete web application: 2FA authentication, MQTT device management, OTA updates, Stripe payments, admin panel, security logs. Only production deployment and monitoring remain.

55%

Firmware

DNS server in Rust, captive portal in Python, OTA with automatic rollback, automatic configuration for 30+ routers. Blocker: rewriting the first-boot system (cloud-init removed from recent Raspberry Pi OS).

50%

Mobile App

4 iOS screens with Capacitor (home, activity, alerts, profile), native 2FA, onboarding, dark theme, Electron desktop version. Missing: Android build, push notifications, offline mode, store publication.

30%

Hardware

Bill of materials, 3D model of the case, wiring diagram. Missing: Custom PCB design (ditching raspberry pi and reducing production cost), thermal testing, certifications, and packaging.

Immediate priority: get the full flow working end-to-end: power on → setup → network service live.
